

Business Requirement Document

CRM Sales Analytics Dashboard

1. Project Overview

This project focuses on preparing business requirements for a CRM Sales Analytics Dashboard. The dashboard helps sales managers and business users track lead performance, sales conversion, revenue, pending follow-ups, overdue follow-ups, sales representative performance, and reasons for lost opportunities.

The project uses a CRM sales dataset of 2,000 records. The dataset includes lead details, sales representative details, lead source, region, lead status, deal value, follow-up status, opportunity status, lost reason, and days to close.

The purpose of this BRD is to define the business problem, project objectives, stakeholder needs, scope, business requirements, assumptions, and expected outcomes before dashboard development.

2. Business Background

The sales team manages leads from multiple sources such as website, referral, social media, email campaigns, and cold calls. These leads move through different stages such as New Lead, Contacted, Interested, Follow Up, Proposal Sent, Negotiation, Converted, Lost, and Not Interested.

Currently, sales reporting depends heavily on manual Excel reports and scattered updates. Managers need to spend additional time checking lead status, follow-up delays, sales performance, and revenue updates.

Due to this manual process, it becomes difficult to get a clear view of sales pipeline health, missed follow-ups, high-performing lead sources, sales representative performance, and major reasons for lost leads.

A CRM Sales Analytics Dashboard is required to provide a centralized view of important sales metrics and support faster business decisions.

3. Business Problem

The sales team does not have a single dashboard to monitor lead conversion, revenue, open pipeline, follow-up status, sales representative performance, and lost reasons.

The current reporting process creates the following problems:

1. Sales managers depend on manual reports for performance review.
2. Overdue follow-ups are difficult to identify on time.
3. Lead conversion performance is not visible in one place.
4. Sales representative performance is difficult to compare.
5. Revenue and open pipeline value are not tracked clearly.
6. Lead source effectiveness is not easy to measure.
7. Lost reasons are not analyzed properly.
8. Data quality issues can affect reporting accuracy.

Because of these gaps, managers may miss important leads, delay follow-ups, and struggle to make timely sales decisions.

4. Business Objective

The main objective of this project is to define business requirements for a CRM Sales Analytics Dashboard that helps the sales team and management track sales performance more clearly.

The dashboard aims to:

- Provide a single view of sales pipeline performance.
- Track total leads, converted leads, lost leads, and open opportunities.
- Monitor sales revenue and open pipeline value.
- Identify overdue and pending follow-ups.
- Compare sales representative performance.
- Analyze lead source effectiveness.
- Understand common reasons for lost opportunities.
- Support business users with filters for date, region, sales representative, lead source, lead status, and opportunity status.
- Improve reporting accuracy through defined KPI logic and validation rules.

5. Stakeholders

Stakeholder	Role / Responsibility
Sales Manager	Reviews sales performance, follow-ups, and conversion trends
Business Head	Tracks revenue, pipeline value, and overall business performance
Sales Representatives	Manage assigned leads and update lead status
Marketing Team	Reviews lead source performance and campaign quality
Data Analyst	Prepares data, KPI logic, reporting logic, and dashboard insights
Business Analyst	Gathers requirements, prepares BRD/FRD, user stories, process flow, and UAT checklist
CRM Admin	Maintains CRM data and supports data availability

6. Current Process

The current sales reporting process works as follows:

1. Leads are generated from multiple sources such as website, referral, email campaign, cold call, and social media.
2. Leads are assigned to sales representatives.
3. Sales representatives contact the leads and update the lead status.
4. Follow-up dates are added manually.
5. Leads move through different stages such as Contacted, Interested, Proposal Sent, Negotiation, Converted, Lost, or Not Interested.
6. Managers review sales performance using Excel reports or manual summaries.
7. Follow-up tracking, lost reason analysis, and sales rep comparison require manual effort.

6.1 Current Pain Points

The current process has the following pain points:

- Reporting is manual and time-consuming.
- Sales managers do not get quick visibility into overdue follow-ups.
- Sales representatives' performance is not easy to compare.
- Lead source quality is not clearly visible.
- Revenue from converted leads is not tracked in a structured dashboard.
- Open pipeline value is difficult to monitor.
- Lost reasons are not analyzed properly.
- Manual reports increase the chances of calculation errors.
- Business users cannot easily filter reports by region, date, sales rep, or lead source.

7. Proposed Solution

The proposed solution is to create a CRM Sales Analytics Dashboard that provides a centralized view of sales pipeline, lead conversion, revenue, follow-up status, and sales team performance.

The dashboard will help business users answer questions such as:

- How many leads are currently available?
- How many leads are converted, lost, or still open?
- What is the overall conversion rate?
- Which sales representatives are performing better?
- Which lead sources generate better conversions?
- What is the total revenue from converted leads?
- What is the open pipeline value?
- Which follow-ups are overdue?
- What are the main reasons for lost leads?

- Which region has better sales performance?

8. Project Scope

In-Scope

The following items are included in the scope of this project:

- Lead performance tracking
- Lead status analysis
- Conversion rate tracking
- Revenue tracking
- Open pipeline value tracking
- Sales representative performance analysis
- Region-wise performance analysis
- Lead source performance analysis
- Lost reason analysis
- Follow-up status tracking
- Overdue follow-up monitoring
- Dashboard filters
- KPI logic definition
- Data quality validation rules
- UAT checklist preparation

Out-of-Scope

The following items are not included in this project:

- CRM software development
- Real-time CRM integration
- Automated email or SMS follow-ups
- Marketing campaign cost analysis
- Customer support ticket analysis
- Payment tracking
- Forecasting using machine learning
- Live API-based reporting
- Role-based login system

9. Dataset Overview

The project uses a CRM sales dataset with 2,000 records.

Key dataset fields include:

Field Name	Description
Lead_ID	Unique identifier for each lead
Lead_Source	Source from where the lead is generated
Region	Sales region assigned to the lead
Sales_Rep	Sales representative handling the lead
Lead_Status	Current status of the lead
Deal_Value	Potential or converted deal value
Created_Date	Date when the lead is created
Followup_Date	Date for next follow-up
Closed_Date	Date when lead is closed
Lost_Reason	Reason for lost or not interested lead
Days_To_Close	Number of days taken to close the opportunity
Followup_Status	Status of follow-up such as Upcoming, Overdue, Due Today, or Closed
Opportunity_Status	Indicates whether the opportunity is Open or Closed

10. Business Requirements

Requirement ID	Business Requirement
BR-01	The dashboard should show total leads, converted leads, lost leads, and open opportunities.
BR-02	The dashboard should display overall conversion rate.
BR-03	The dashboard should show total revenue from converted leads.
BR-04	The dashboard should show open pipeline value for active opportunities.
BR-05	The dashboard should identify overdue and pending follow-ups.
BR-06	The dashboard should compare sales representative performance.
BR-07	The dashboard should analyze lead performance by source.
BR-08	The dashboard should show region-wise sales performance.
BR-09	The dashboard should display reasons for lost or not interested leads.
BR-10	The dashboard should allow users to filter data by date, region, sales rep, lead source, lead status, and opportunity status.
BR-11	The dashboard should support validation of KPI calculations and reporting logic.
BR-12	The dashboard should help managers take action on delayed follow-ups and weak-performing areas.

10.1 KPI Requirements

The dashboard should include the following key performance indicators:

KPI	Business Purpose
Total Leads	Shows total number of leads generated
Converted Leads	Shows leads successfully converted into customers
Lost Leads	Shows leads lost during the sales process
Conversion Rate	Measures sales effectiveness
Total Revenue	Shows revenue from converted deals
Open Pipeline Value	Shows potential revenue from open opportunities
Average Deal Value	Shows average value of converted deals
Pending Follow-ups	Shows leads that require future follow-up
Overdue Follow-ups	Shows leads where follow-up date has passed
Average Days to Close	Measures average sales cycle duration

10.2 Reporting and Filter Requirements

The dashboard should allow users to filter and analyze data using the following filters:

Filter	Purpose
Date Range	To analyze sales performance for a selected period
Region	To view region-wise performance
Sales Representative	To analyze individual sales rep performance
Lead Source	To compare lead source quality
Lead Status	To analyze pipeline stage
Opportunity Status	To separate open and closed opportunities
Product / Service	To analyze performance by product or service, if available

11. Expected Dashboard Sections

The dashboard is expected to include the following sections:

11.1 Executive Summary

This section shows high-level business KPIs such as Total Leads, Converted Leads, Conversion Rate, Total Revenue, Open Pipeline Value, and Overdue Follow-ups.

11.2 Sales Pipeline Analysis

This section shows lead distribution by Lead Status and Opportunity Status. It helps managers understand how many leads are open, converted, lost, or not interested.

11.3 Sales Representative Performance

This section compares sales representatives based on leads handled, converted leads, revenue, conversion rate, and overdue follow-ups.

11.4 Lead Source Analysis

This section helps the business understand which lead sources generate more leads and better conversions.

11.5 Region-Wise Analysis

This section shows sales performance across different regions.

11.6 Lost Reason Analysis

This section shows major reasons for lost or not interested leads, such as budget issue, competitor chosen, no requirement, or decision deferred.

11.7 Follow-Up Tracking

This section highlights pending, upcoming, due today, overdue, and closed follow-ups.

12. Assumptions

The following assumptions are considered for this project:

- The dataset is clean enough to support dashboard planning after basic validation.
- Each Lead_ID represents one unique lead.
- Converted leads are treated as successful sales.
- Lost and Not Interested leads are treated as closed opportunities.
- Open opportunities include New Lead, Contacted, Interested, Follow Up, Proposal Sent, and Negotiation.
- Revenue is calculated only from converted leads.
- Follow-up tracking applies only to open opportunities.
- This is a sample portfolio project and does not represent a real company's confidential data.

13. Success Criteria

The project is considered successful if:

- Business requirements are clearly documented.
- Dashboard KPIs are clearly defined.
- Lead status mapping is correct.
- Reporting logic is easy to understand.
- Dashboard filters are clearly listed.
- User stories and acceptance criteria can be created from the BRD.
- UAT test cases can validate the dashboard requirements.
- The final dashboard supports sales performance monitoring and decision-making.

14. Conclusion

This BRD defines the business need, objectives, scope, stakeholders, business rules, KPI requirements, and expected outcomes for the CRM Sales Analytics Dashboard.
