

CRM Sales Analytics Dashboard Requirement Documentation Project

Project Summary

I've created this project to show business analyst skills through a CRM Sales Analytics Dashboard requirement document. The main aim is to understand a sales reporting problem and convert it into clear business requirements, functional requirements, KPIs, user stories, acceptance criteria, process flow, and UAT checklist.

The business scenario focuses on a sales team that manages leads from different sources such as website, referral, social media, email campaigns, and cold calls.

The current process depends on manual Excel reports, which makes it difficult for managers to track lead conversion, revenue, pending follow-ups, sales rep performance, and reasons for lost leads.

To solve this, I've created a CRM Sales Analytics Dashboard. A dataset of 2,000 CRM sales records supports the project.

Dataset includes fields like:

Lead ID, Lead Source, Region, Sales Representative, Lead Status, Deal Value, Follow-up Date, Closed Date, Lost Reason, Days to Close, Follow-up Status, and Opportunity Status

As part of the project, I prepare a sample BRD and FRD to define the project objective, stakeholders, business problem, dashboard requirements, filters, KPIs, and reporting logic. I also create user stories and acceptance criteria from the point of view of sales managers, business heads, and marketing teams.

key KPIs include:

Total Leads, Converted Leads, Conversion Rate, Total Revenue, Open Pipeline Value, Overdue Follow-ups, Lost Leads, Average Deal Value, and Average Days to Close.

I also prepare a UAT checklist to validate the dashboard before delivery. This includes checks for KPI accuracy, filter behavior, revenue calculation, overdue follow-up logic, lost reason logic, and data quality issues like negative Days to Close.

This project helped me show that I can work beyond dashboard creation. It highlights my ability to understand business problems, document requirements, define KPIs, write user stories, map processes, and support dashboard validation like a Business Analyst.
